REC'D 18 NOV 2003	
WIPO	PCT

The Patent Office  
Concept House  
Cardiff Road  
Newport  
South Wales  
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

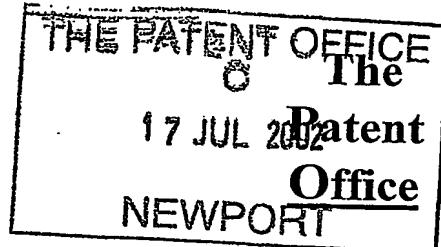

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- a) If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- d) If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- e) Once you have filled in the form you must remember to sign and date it.
- f) For details of the fee and ways to pay please contact the Patents Office.

~11019P1GB

IMPROVEMENTS IN OR RELATING TO CONTAINERS

The present invention relates to a water-soluble container and to a process for the preparation of such a 5 container.

It is known to package chemical compositions, particularly those which may be of a hazardous or irritant nature, in films, particularly water-soluble films. Such 10 containers can simply be added to water in order to dissolve or disperse the contents of the container into the water.

For example, WO 89/12587 discloses a package, which comprises an envelope of a water-soluble material, which 15 comprises a flexible wall and a water-soluble heat seal. The package may contain an organic liquid comprising, for example, a pesticide, fungicide, insecticide or herbicide.

WO 92/17382 discloses a package containing an 20 agrochemical comprising a first sheet of non-planar water-soluble or water-dispersible material and a second sheet of water-soluble or water-dispersible material superposed on the first sheet and sealed to it.

25 WO 01/85898 discloses a two-compartment water-soluble package in which an open compartment is sealed with a pre-sealed compartment.

Such arrangements have, however, a number of 30 difficulties. In particular, there may be difficulties if the packages contain compositions which generate a gas because the gas inflates the packages, particularly if they

11019P1GB

are flexible, and may burst them. Such packages are especially susceptible to bursting at weak points such as at the seals. We have surprisingly found that this problem may occur even with compositions which are not normally considered to generate a gas. For example, it can occur with moisture-sensitive compositions, such as a bleach, which generate gas upon coming into contact with water or water-vapour, which may permeate into the interior of the package through the package walls.

10

The present invention provides a water-soluble container comprising at least one first compartment, each first compartment containing a composition that comprises less than 5 wt% free water, and a second compartment containing a second composition, wherein the second composition generates a gas on exposure to the atmosphere or water, and more than 50% of the surface area of the second compartment is enclosed by the first compartment or first compartments.

20

The present invention also provides a process for producing a container as defined above, which comprises:

- i) forming an open container, at least partially filling the container with the first composition and with the second compartment containing the second composition and sealing the container to form the first compartment; or
- ii) forming an open container, at least partially filling the container with the first composition and sealing the container to form the first compartment, said container being sealed with a sealing member, such as a film, having a second compartment comprising the second composition.

The term "water-soluble" is taken to include water dispersible.

The term "free water" is defined in WO 02/16222, herein  
5 incorporated by reference. There is no direct correlation  
between the actual amount of water present in a composition  
and the amount of free water as required in the present  
invention. Free water does not includes water which is not  
available to the surrounding compartment such as water held  
10 within a gelled matrix or water of solvation of any  
components present in the composition.

In order to determine the amount of free water present  
in a composition, a standard loss-on-drying determination  
15 test may be carried out. A sample of the composition,  
usually about 10 g, is weighed, and then maintained at 60°C  
for 3 hours under a partial vacuum of 200 mbar (20 kPa).  
The sample is then re-weighed, and the weight lost  
determined. In the present invention, the loss on drying  
20 the first composition must be less than 5 wt%, preferably  
less than 4, 3, 2 or 1 wt%. Even more preferably the first  
composition is anhydrous. The first composition may be a  
solid or a liquid.

25 Preferably, the second composition comprises less than  
5 wt % free water, preferably less than 4, 3, 2 or 1 wt%.  
Even more preferably the second composition is anhydrous.  
The second composition may be a solid or a liquid.

30 The second composition may generate a gas for a number  
of reasons. For example, the second composition may generate  
a gas by interaction with one or more components of the

11019P1GB

atmosphere, especially water vapour or oxygen, which may diffuse or otherwise travel through the container walls. The second composition may also generate a gas, for example, when exposed other components which can diffuse or otherwise travel through the container walls other than from the atmosphere, for example from other compartments such as the first compartment. Such components include, for example, water.

As indicated above, we have found that certain compositions release a gas when contacted with water or water vapour. Surprisingly, this can occur even when these moisture-sensitive compositions are surrounded by a wall of a material. We have, in particular, found that some materials used as walls of water-soluble containers may not be completely water-impermeable, but may have a degree of water-permeability. While the degree of water-permeability may be slight, it may be sufficient to allow a small amount of water to permeate through the wall, for example, from the atmosphere. Since water-soluble containers may be stored for some time, for example for several months or even years, gas may gradually be generated by contact of the moisture-sensitive composition with water, which may consequently cause the container to burst. The container may burst by means of a tear through the wall or by failure of a seal. It may also burst internally, allowing different compositions held within the container to mix. This problem is eliminated or at least alleviated in the containers of the present invention in which the second compartment is at least partially shielded from the atmosphere by the first compartment. Thus, the amount of gas produced by the second composition is reduced, or even eliminated. For this reason,

11019P1GB

the risk of bursting due to the internal generation of a gas is reduced, or even eliminated.

In the containers of the present invention, more than 5 50% of the outer surface area of the second compartment is enclosed by the first compartment. Preferably, more than 60%, for example, 70% to 100%, especially 80% to 90% of the surface area of the second compartment is enclosed by the first compartment. The container of the present invention 10 may comprise only the first and second compartments, or may comprise one or more further compartments. The further compartments may also be partly or fully enclosed by at least one of the first compartment(s) if desired.

15 The gas may be any gas but is usually one or more of O<sub>2</sub>, CO<sub>2</sub>, N<sub>2</sub>, Cl<sub>2</sub>, HCl or the volatile ingredients of a fragrance.

The container may, if desired, include a gas release means. The gas release means may take any form that allows 20 the escape of gas generated inside one or more compartments of the container. In particular the first compartment and/or the second compartment may comprise a gas release means. A gas release means may be present in the first compartment since this compartment is not shielded from the atmosphere. A gas release means may be present in the 25 second compartment to assist further in preventing the build-up of a gas in the compartment. Preferably, the gas release means is included in the second compartment. Therefore, the surface area of the second compartment 30 enclosed by the first compartment(s) may be less than 100% to allow the second compartment to expel gas.

The gas release means may, for example, take the form of a vent. A vent may comprise a one-way valve, for example one or more holes covered with one or more flaps. Most preferably, however, the vent is simply one or more holes. A 5 single hole may be provided, although an array, either regular or irregular, may also be provided. Suitably, the hole or holes each have a maximum dimension of 0.1 to 2 mm. The maximum dimension is the diameter of the hole if the hole is circular. Preferably the hole or holes have a 10 maximum dimension of 0.2 to 1.5 mm, especially about 0.5 to 1 mm, more especially about 0.8 mm.

The vent may be provided simply by forming a hole or holes in the container, for example by use of a needle. 15 Other means such as a laser, a strong gas beam or a projectile such as a particle may also be used. The hole or holes are generally provided after the container has been formed, although it may also be provided earlier in the process if desired. It is also possible to include a hole 20 or holes at the time of forming the container, for example, by providing a mould with means of an appropriate shape to form the hole or holes at the same time that the container is formed.

25 The gas release means may also, for example, comprise a permeable wall or wall section of one or more compartments of the container. An example is a permeable wall or wall section that has microchannels therein. Such microchannels can be formed by any means. For example, the microchannels 30 may be provided by including particles in the wall or wall section. Suitable particles are polyethylene, polypropylene or starch particles. Preferably, the particles are water-

11019P1GB

soluble. These particles may be included in the polymer composition, for example, by using a bi-injection moulding process. In general, the particles have a diameter of at least the wall thickness. The amount of particles included 5 should be such that agglomerates form.

Another possible way of providing the container with gas release means is to form at least part of the container with a polymer that is inherently gas permeable. It is, of 10 course, necessary that the polymer is permeable to the gas being generated inside the container. An example of such a polymer is a cellulose derivative.

A further possibility is to generate a gas pressure 15 sensitive membrane, for example comprising areas of weakness in the container designed to open as the gas pressure rises in the container. Areas of weakness can easily be generated by, for example, pressing a dimpled stamp onto the surface.

20 If a gas release means is present, it should be such that it does not allow any of the liquid or solid contents of the container to leak out until the container is dissolved in water.

25 The container of the present invention can have an attractive appearance because it contains at least two compositions, which are advantageously held in a fixed position in relation to each other. The compositions can be easily differentiated to accentuate their difference. For 30 example, the compositions may be coloured differently, or may be in a different physical state. The first composition and the second composition are independently in the form of,

11019P1GB

for example, a liquid (e.g. a thickened liquid or gel) or a solid (e.g. a powder, granules or a compressed solid). In one embodiment, the first composition is a liquid or gel, while the second composition is a solid or semi-solid.

5 Thus, for example, the container can have an appearance of a fried egg or eyeball.

The container may contain two components that are incompatible with each other. It may also contain a 10 component that is incompatible with the part of the container enclosing the other component. For example, one composition may be incompatible with the part of the container enclosing another composition.

15 In one embodiment, one or more second compartments are fully enclosed by the first compartment. For example, the second composition may be enclosed in a second compartment formed of, for example, a film of a water-soluble polymer. Another possibility is for the second composition to be 20 coated with a water-soluble polymer, for example by spraying. The second compartment may be placed in a container (first compartment) containing the first composition. Thus, the second compartment may be regarded as an inner compartment within an outer compartment (first 25 compartment) defined by the container. Both the outer compartment and inner compartment(s) may each be provided with gas release means, such as the ones herein described. Alternatively, only the inner or the outer compartment is provided with a gas release means.

30

The second compartment may be fixed to the first compartment, or may be free. Such containers can be

11019P1GB

produced by any method; for example, by forming the outer compartment, filling it with the desired composition and the pre-prepared inner compartment, and then sealing the outer compartment. The outer compartment and the inner

5 compartment can be produced by any method. Examples of suitable methods by which each compartment may be independently prepared are vertical form fill sealing, thermoforming and injection moulding.

10 Where the first or second composition is in the form of a solid, the solid may be coated, for example, spray coated with a material, which solidifies to form the compartment for the solid. For example, the solid may be coated with a water-soluble polymer. Suitable polymers include poly(vinyl

15 alcohol) (PVOH), cellulose derivatives such as hydroxypropyl methyl cellulose (HPMC) and gelatin. Preferably, HPMC is employed. Spray coating is useful for enclosing solids that are relatively small, for example, 5 to 30 mm, preferably, 10 to 20 mm in dimension. For example, it may be difficult

20 to enclose a solid having such small dimensions using a thermoformed sheet of material, without creating unacceptably large seal areas. In a preferred embodiment, the second compartment is formed by a coated, such as a spray-coated, layer of material. In such an embodiment, the 25 second compartment may take the form of a sphere containing the second composition. For example, the second composition may be a compacted solid composition consisting of or comprising a bleach.

30 The thickness of the coating is preferably 40 to 300  $\mu\text{m}$ , more preferably, 80 to 200  $\mu\text{m}$ , especially, 100 to 160

μm, more especially, 100 to 150 and most especially, 120 to 1550 μm.

In an alternative embodiment, the container comprises a  
5 first compartment containing the first composition, and a sealing member that is employed to seal the first composition in the first compartment, as illustrated in WO 01/85898, although care will need to be taken to ensure that the compartments have the special relationship herein  
10 defined. The sealing member comprises a second compartment for the second composition. For example, the second compartment may take the form of a housing attached to the underside of the sealing member. When the sealing member is positioned over the first compartment, the housing is  
15 located within the first compartment. The housing may share at least one wall section or wall in common with the sealing member. The remaining walls or wall sections of the housing may be surrounded by the first composition in the first compartment. Preferably, from 50 to 90 %, more preferably  
20 from 60 to 80%, of the surface area of the housing is enclosed by the first compartment. In this embodiment, the sealing member may be provided with a gas release means, for example, one of the means herein described.

25 The container of the present invention may have more than two compartments, for example, three, four, five or six compartments. In one embodiment, the first compartment is divided into two or more sub-compartments, for example, three or four compartments. Each of these compartments may  
30 contain a different composition. Alternatively, some or all of the compartments may contain the same composition. The second compartment may also be divided into a number of sub-

11019P1GB

compartments, for example, two, three, four or five sub-compartments. Each of these compartments may contain a different composition. Alternatively, some or all of the compartments may contain the same composition. Each of the 5 compartments may be formed using any suitable material. For example, any one of the materials herein described may be employed.

In one embodiment, the container comprises a second 10 compartment, which is enclosed by two or more first compartments. In this way, more than 50% of the surface area of the second compartment is enclosed by the two or more first compartments. Preferably, the second compartment is sandwiched between two or more first compartments.

15

It is possible to ensure that one of the compositions is released at a different time to the other(s). For instance, one composition can be released immediately the container is added to water, whereas the other may be 20 released later. This may be achieved by having a compartment that takes longer to dissolve surrounding one of the compositions. This may be achieved, for example, by having different compartment wall thicknesses. It may also be achieved by choosing compartment walls that dissolve at 25 different temperatures, for example the different temperatures encountered during the cycle of a laundry or dish washing machine.

In one embodiment, the first compartment is of, for 30 example, a moulded composition, especially one produced by injection moulding or blow moulding. The first compartment may have a wall thickness of, for example, greater than 100

11019P1GB

μm, for example greater than 150 μm or greater than 200 μm, 300 μm, 500 μm, 750 μm or 1mm. Preferably, the wall thickness is from 200 to 400μm.

5 The first compartment may also, for example, be formed of a film. The film may be a single film, or a laminated film as disclosed in GB-A-2,244,258. While a single film may have pinholes, the two or more layers in a laminate are unlikely to have pinholes that coincide.

10

The film may be produced by any process, for example by extrusion and blowing or by casting. The film may be unoriented, monoaxially oriented or biaxially oriented. If the layers in the film are oriented, they usually have the 15 same orientation, although their planes of orientation may be different if desired.

The layers in a laminate may be the same or different. Thus they may each comprise the same polymer or a different 20 polymer.

Examples of water-soluble polymers which may be used in a single layer film or in one or more layers of a laminate or which may be used for injection moulding or blow moulding 25 are poly(vinyl alcohol) (PVOH), cellulose derivatives such as hydroxypropyl methyl cellulose (HPMC) and gelatin. An example of a preferred PVOH is ethoxylated PVOH. The PVOH may be partially or fully alcoholised or hydrolysed. For example it may be from 40 to 100%, preferably from 70 to 30 92%, more preferably about 88% or about 92%, alcoholised or hydrolysed. The degree of hydrolysis is known to influence the temperature at which the PVOH starts to dissolve in

water. 88% hydrolysis corresponds to a film soluble in cold (ie room temperature) water, whereas 92% hydrolysis corresponds to a film soluble in warm water.

5       The thickness of the film used to produce the container, is preferably 40 to 300 µm, more preferably 80 to 200 µm, especially 100 to 160 µm, more especially 100 to 150 µm and most especially 120 to 150 µm.

10       In one embodiment, the film is vacuum formed or thermoformed into a first compartment or pocket for the first composition. For example, in a thermoforming process the film may be drawn down or blown down into a mould. Thus, for example, the film is heated to the thermoforming 15 temperature using a thermoforming heater plate assembly, and then drawn down under vacuum or blown down under pressure into the mould. Plug-assisted thermoforming and pre-stretching the film, for example by blowing the film away from the mould before thermoforming, may, if desired, be 20 used. One skilled in the art can choose an appropriate temperature, pressure or vacuum and dwell time to achieve an appropriate shape. The amount of vacuum or pressure and the thermoforming temperature used depend on the thickness and porosity of the film and on the polymer or mixture of 25 polymers being used. Thermoforming of PVOH films is known and described in, for example, WO 00/55045 and WO 01/85898.

A suitable forming temperature for PVOH or ethoxylated PVOH is, for example, from 90 to 130°C, especially 90 to 30 120°C. A suitable forming pressure is, for example, 69 to 138kPa (10 to 20 p.s.i.), especially 83 to 117 kPa (12 to 17 p.s.i.). A suitable forming vacuum is 0 to 4 kPa (0 to 40

11019P1GB

mbar), especially 0 to 2 kPa (0 to 20 mbar). A suitable dwell time is, for example, 0.4 to 2.5 seconds, especially 2 to 2.5 seconds.

5 While desirably conditions chosen within the above ranges, it is possible to use one or more of these parameters outside the above ranges, although it may be necessary to compensate by changing the values of the other two parameters.

10

Once formed, the pocket may be filled with the first composition. The pocket may be completely filled or only partially filled. The composition may be a solid. For example, it may be a particulate or granulated solid, or a 15 tablet. Preferably, however, the first composition is a liquid, which may be thickened or gelled, if desired. More preferably, the first composition is a transparent liquid, especially, a coloured, transparent liquid. The liquid composition may be non-aqueous or aqueous, although 20 comprising less than 5% free water as defined in WO 02/16222. The composition may have more than one phase. For example it may comprise an aqueous composition and a liquid composition that is immiscible with the aqueous composition. It may also comprise a liquid composition and 25 a separate solid composition, for example in the form of a ball, pill or speckles.

The actual amount of water present in the first or second composition may be in excess of the amount of free 30 water as defined above since the total water content includes water of solvation and water held within a gelled matrix. The total amount of water in the first and/or

11019P1GB

second composition is, for example, more than 5, 10, 15, 20, 25 or 30wt%. The total water content may be less than 80 wt%, for example less than 70, 60, 50, 40 wt%.

5       The first composition may be any composition that is intended to be released in an aqueous environment. Thus, for example, it may be an agrochemical composition such as a plant protection agent, for instance a pesticide such as an insecticide, fungicide, herbicide, acaricide, or nematocide,  
10      a plant growth regulator or a plant nutrient. Such compositions are generally packaged in amounts of from 0.1 g to 7 kg, preferably 1 to 5 kg, when in solid form. When in liquid or gelled form, such compositions are generally packaged in amounts of from 1 ml to 10 litres, preferably  
15      0.1 to 6 litres, especially from 0.5 to 1.5 litres.

The first composition may also be a fabric care, surface care or dishwashing composition. Thus, for example, it may be a dishwashing, water-softening, laundry or  
20      detergent composition, or a rinse aid. Such compositions may be suitable for use in a domestic washing machine. The composition may also be a disinfectant, antibacterial or antiseptic composition, or a refill composition for a trigger-type spray. Such compositions are generally  
25      packaged in amounts of from 5 to 100 g, especially from 15 to 40 g. For example, a dishwashing composition may weigh from 15 to 30 g, a water-softening composition may weigh from 15 to 40 g. Preferably, the first composition is a detergent composition for laundry.

30

The first composition, if in liquid form, may be anhydrous. Alternatively, the first composition may comprise

11019P1GB

water, preferably, in an amount of from 0 to 10 wt %, more preferably, from 0 to 5 wt %, and especially, from 0 to 2 wt %.

5 The remaining ingredients of the first composition depend on the use of the composition. Thus, for example, the composition may contain surface active agents such as an anionic, nonionic, cationic, amphoteric or zwitterionic surface active agents or mixtures thereof.

10

Examples of anionic surfactants are straight-chained or branched alkyl sulfates and alkyl polyalkoxylated sulfates, also known as alkyl ether sulfates. Such surfactants may be produced by the sulfation of higher C<sub>8</sub>-C<sub>20</sub> fatty alcohols.

15

Examples of primary alkyl sulfate surfactants are those of formula:

wherein R is a linear C<sub>8</sub>-C<sub>20</sub> hydrocarbyl group and M is 20 a water-solubilising cation. Preferably R is C<sub>10</sub>-C<sub>16</sub> alkyl, for example C<sub>12</sub>-C<sub>14</sub>, and M is alkali metal such as lithium, sodium or potassium.

Examples of secondary alkyl sulfate surfactants are 25 those which have the sulfate moiety on a "backbone" of the molecule, for example those of formula:

wherein m and n are independently 2 or more, the sum of m+n typically being 6 to 20, for example 9 to 15, and M is a 30 water-solubilising cation such as lithium, sodium or potassium.

Especially preferred secondary alkyl sulfates are the (2,3) alkyl sulfate surfactants of formulae:

5

for the 2-sulfate and 3-sulfate, respectively. In these formulae x is at least 4, for example 6 to 20, preferably 10 to 16. M is cation, such as an alkali metal, for example lithium, sodium or potassium.

Examples of alkoxylated alkyl sulfates are ethoxylated alkyl sulfates of the formula:

15

wherein R is a C<sub>8</sub>-C<sub>20</sub> alkyl group, preferably C<sub>10</sub>-C<sub>18</sub> such as a C<sub>12</sub>-C<sub>16</sub>, n is at least 1, for example from 1 to 20, preferably 1 to 15, especially 1 to 6, and M is a salt-forming cation such as lithium, sodium, potassium, ammonium, alkylammonium or alkanolammonium. These compounds can provide especially desirable fabric cleaning performance benefits when used in combination with alkyl sulfates.

25

The alkyl sulfates and alkyl ether sulfates will generally be used in the form of mixtures comprising varying alkyl chain lengths and, if present, varying degrees of alkoxylation.

30

Other anionic surfactants which may be employed are salts of fatty acids, for example C<sub>8</sub>-C<sub>18</sub> fatty acids,

11019P1GB

especially the sodium or potassium salts, and alkyl, for example C<sub>8</sub>-C<sub>18</sub>, benzene sulfonates.

Examples of nonionic surfactants are fatty acid  
5 alkoxylates, such as fatty acid ethoxylates, especially those of formula:

10 wherein R is a straight or branched C<sub>8</sub>-C<sub>16</sub> alkyl group, preferably a C<sub>9</sub>-C<sub>15</sub>, for example C<sub>10</sub>-C<sub>14</sub>, alkyl group and n is at least 1, for example from 1 to 16, preferably 2 to 12, more preferably 3 to 10.

15 The alkoxylated fatty alcohol nonionic surfactant will frequently have a hydrophilic-lipophilic balance (HLB) which ranges from 3 to 17, more preferably from 6 to 15, most preferably from 10 to 15.

20 Examples of fatty alcohol ethoxylates are those made from alcohols of 12 to 15 carbon atoms and which contain about 7 moles of ethylene oxide. Such materials are commercially marketed under the trademarks Neodol 25-7 and Neodol 23-6.5 by Shell Chemical Company. Other useful  
25 Neodols include Neodol 1-5, an ethoxylated fatty alcohol averaging 11 carbon atoms in its alkyl chain with about 5 moles of ethylene oxide; Neodol 23-9, an ethoxylated primary C<sub>12</sub>-C<sub>13</sub> alcohol having about 9 moles of ethylene oxide; and Neodol 91-10, an ethoxylated C<sub>9</sub>-C<sub>11</sub> primary alcohol having  
30 about 10 moles of ethylene oxide.

11019P1GB

Alcohol ethoxylates of this type have also been marketed by Shell Chemical Company under the Dobanol trademark. Dobanol 91-5 is an ethoxylated C<sub>9</sub>-C<sub>11</sub> fatty alcohol with an average of 5 moles ethylene oxide and 5 Dobanol 25-7 is an ethoxylated C<sub>12</sub>-C<sub>15</sub> fatty alcohol with an average of 7 moles of ethylene oxide per mole of fatty alcohol.

Other examples of suitable ethoxylated alcohol nonionic surfactants include Tergitol 15-S-7 and Tergitol 15-S-9, both of which are linear secondary alcohol ethoxylates available from Union Carbide Corporation. Tergitol 15-S-7 is a mixed ethoxylated product of a C<sub>11</sub>-C<sub>15</sub> linear secondary alkanol with 7 moles of ethylene oxide and Tergitol 15-S-9 15 is the same but with 9 moles of ethylene oxide.

Other suitable alcohol ethoxylated nonionic surfactants are Neodol 45-11, which is a similar ethylene oxide condensation products of a fatty alcohol having 14-15 carbon 20 atoms and the number of ethylene oxide groups per mole being about 11. Such products are also available from Shell Chemical Company.

Further nonionic surfactants are, for example, C<sub>10</sub>-C<sub>18</sub> 25 alkyl polyglycosides, such as C<sub>12</sub>-C<sub>16</sub> alkyl polyglycosides, especially the polyglucosides. These are especially useful when high foaming compositions are desired. Further surfactants are polyhydroxy fatty acid amides, such as C<sub>10</sub>-C<sub>18</sub> N-(3-methoxypropyl) glyciamides and ethylene oxide-propylene 30 oxide block polymers of the Pluronic type.

Examples of cationic surfactants are those of the quaternary ammonium type.

The total content of surfactants in the composition is desirably 60 to 95 wt%, especially 75 to 90 wt%. Desirably an anionic surfactant is present in an amount of 50 to 75 wt%, the nonionic surfactant is present in an amount of 5 to 50 wt%, and/or the cationic surfactant is present in an amount of from 0 to 20 wt%. The amounts are based on the total solids content of the composition, i.e. excluding any solvent which may be present.

The compositions, particularly when used as laundry washing or dishwashing compositions, may also independently comprise enzymes, such as protease, lipase, amylase, cellulase and peroxidase enzymes. Such enzymes are commercially available and sold, for example, under the registered trade marks Esperase, Alcalase and Savinase by Nova Industries A/S and Maxatase by International Biosynthetics, Inc. Desirably the enzymes are independently present in the compositions in an amount of from 0.5 to 3 wt%, especially 1 to 2 wt%, when added as commercial preparations they are not pure and this represents an equivalent amount of 0.005 to 0.5 wt% of pure enzyme.

The compositions may, if desired, independently comprise a thickening agent or gelling agent. Suitable thickeners are polyacrylate polymers such as those sold under the trade mark CARBOPOL, or the trade mark ACUSOL by Rohm and Haas Company. Other suitable thickeners are xanthan gums. The thickener, if present, is generally

present in an amount of from 0.2 to 4 wt%, especially 0.5 to 2 wt%.

Compositions used in dishwashing independently usually  
5 comprise a detergency builder. The builders counteract the  
effects of calcium, or other ion, water hardness. Examples  
of such materials are citrate, succinate, malonate,  
carboxymethyl succinate, carboxylate, polycarboxylate and  
polyacetyl carboxylate salts, for example with alkali metal  
10 or alkaline earth metal cations, or the corresponding free  
acids. Specific examples are sodium, potassium and lithium  
salts of oxydisuccinic acid, mellitic acid, benzene  
polycarboxylic acids, C<sub>10</sub>-C<sub>22</sub> fatty acids and citric acid.  
Other examples are organic phosphonate type sequestering  
15 agents such as those sold by Monsanto under the trade mark  
Dequest and alkylhydroxy phosphonates. Citrate salts and  
C<sub>12</sub>-C<sub>18</sub> fatty acid soaps are preferred. Further builders are;  
phosphates such as sodium, potassium or ammonium salts of  
mono-, di- or tri-poly or oligo-phosphates; zeolites;  
20 silicates, amorphous or structured, such as sodium,  
potassium or ammonium salts.

Other suitable builders are polymers and copolymers  
known to have builder properties. For example, such  
25 materials include appropriate polyacrylic acid, polymaleic  
acid, and polyacrylic/polymaleic and copolymers and their  
salts, such as those sold by BASF under the trade mark  
Sokalan.

30 The builder is desirably present in an amount of up to  
90 wt%, preferably 15 to 90 wt%, more preferable 15 to 75  
wt%, relative to the total weight of the composition.

11019P1GB

Further details of suitable components are given in, for example, EP-A-694,059, EP-A-518,720 and WO 99/06522.

The compositions can also optionally comprise one or 5 more additional ingredients. These include conventional detergent composition components such as further surfactants, bleaches, bleach enhancing agents, builders, suds boosters or suds suppressors, anti-tarnish and anti-corrosion agents, organic solvents, co-solvents, phase 10 stabilisers, emulsifying agents, preservatives, soil suspending agents, soil release agents, germicides, pH adjusting agents or buffers, non-builder alkalinity sources, chelating agents, clays such as smectite clays, enzyme 15 stabilizers, anti-limescale agents, colourants, dyes, hydrotropes, dye transfer inhibiting agents, brighteners, and perfumes. If used, such optional ingredients will generally constitute no more than 10 wt%, for example from 1 to 6 wt%, the total weight of the compositions.

20 Compositions which comprise an enzyme may optionally contain materials which maintain the stability of the enzyme. Such enzyme stabilizers include, for example, polyols such as propylene glycol, boric acid and borax. Combinations of these enzyme stabilizers may also be 25 employed. If utilized, the enzyme stabilizers generally constitute from 0.1 to 1 wt% of the compositions.

The compositions may optionally comprise materials which serve as phase stabilizers and/or co-solvents. 30 Examples are C<sub>1</sub>-C<sub>3</sub> alcohols such as methanol, ethanol and propanol. C<sub>1</sub>-C<sub>3</sub> alkanolamines such as mono-, di- and triethanolamines can also be used, by themselves or in

11019P1GB

combination with the alcohols. The phase stabilizers and/or co-solvents can, for example, constitute 0 to 1 wt%, preferably 0.1 to 0.5 wt%, of the composition.

5       The compositions may optionally comprise components which adjust or maintain the pH of the compositions at optimum levels. The pH may be from, for example, 1 to 13, such as 8 to 11 depending on the nature of the composition. For example a dishwashing composition desirably has a pH of 10 8 to 11, a laundry composition desirable has a pH of 7 to 9, and a water-softening composition desirably has a pH of 7 to 9. Examples of pH adjusting agents are NaOH and citric acid.

15      The above examples may be used for dish or fabric washing. In particular dish washing formulations are preferred which are adapted to be used in automatic dish washing machines. Due to their specific requirements specialised formulation is required and these are 20 illustrated below

Amounts of the ingredients can vary within wide ranges, however preferred automatic dishwashing detergent compositions herein (which typically have a 1% aqueous solution pH of above 8, more preferably from 9.5 to 12, most preferably from 9.5 to 10.5) are those wherein there is present: from 5% to 90%, preferably from 5% to 75%, of builder; from 0.1% to 40%, preferably from 0.5% to 30%, of bleaching agent; from 0.1% to 15%, preferably from 0.2% to 30 10%, of the surfactant system; from 0.0001% to 1%, preferably from 0.001% to 0.05%, of a metal-containing bleach catalyst; and from 0.1% to 40%, preferably from 0.1%

11019P1GB

to 20% of a water-soluble silicate. Such fully-formulated embodiments typically further comprise from 0.1% to 15% of a polymeric dispersant, from 0.01% to 10% of a chelant, and from 0.00001% to 10% of a deterotive enzyme, though further 5 additional or adjunct ingredients may be present. Detergent compositions herein in granular form typically limit water content, for example to less than 7% free water, for better storage stability.

10       Non-ionic surfactants useful in ADW (Automatic Dish Washing) compositions of the present invention desirably include surfactant(s) at levels of from 2% to 60% of the composition. In general, bleach-stable surfactants are preferred. Non-ionic surfactants generally are well known, 15 being described in more detail in Kirk Othmer's Encyclopedia of Chemical Technology, 3rd Ed., Vol. 22, pp. 360-379, "Surfactants and Detersive Systems", incorporated by reference herein.

20       Preferably the ADW composition comprises at least one non-ionic surfactant. One class of non-ionics are ethoxylated non-ionic surfactants prepared by the reaction of a monohydroxy alkanol or alkylphenol with 6 to 20 carbon atoms with preferably at least 12 moles particularly 25 preferred at least 16 moles, and still more preferred at least 20 moles of ethylene oxide per mole of alcohol or alkylphenol.

Particularly preferred non-ionic surfactants are the 30 non-ionic from a linear chain fatty alcohol with 16-20 carbon atoms and at least 12 moles particularly preferred at

11019P1GB

least 16 and still more preferred at least 20 moles of ethylene oxide per mole of alcohol.

According to one preferred embodiment the non-ionic surfactant additionally comprise propylene oxide units in the molecule. Preferably this PO units constitute up to 25% by weight, preferably up to 20% by weight and still more preferably up to 15% by weight of the overall molecular weight of the non-ionic surfactant. Particularly preferred surfactants are ethoxylated mono-hydroxy alkanols or alkylphenols, which additionally comprises polyoxyethylene-polyoxypropylene block copolymer units. The alcohol or alkylphenol portion of such surfactants constitutes more than 30%, preferably more than 50%, more preferably more than 70% by weight of the overall molecular weight of the non-ionic surfactant.

Another class of non-ionic surfactants includes reverse block copolymers of polyoxyethylene and polyoxypropylene and block copolymers of polyoxyethylene and polyoxypropylene initiated with trimethylolpropane.

Another preferred non-ionic surfactant can be described by the formula:

25

wherein  $R^1$  represents a linear or branched chain aliphatic hydrocarbon group with 4-18 carbon atoms or mixtures thereof,  $R^2$  represents a linear or branched chain aliphatic hydrocarbon rest with 2-26 carbon atoms or

11019P1GB

mixtures thereof,  $x$  is a value between 0.5 and 1.5 and  $y$  is a value of at least 15.

Another group of preferred nonionic surfactants are the  
5 end-capped polyoxalkylated non-ionics of formula:

wherein  $R^1$  and  $R^2$  represent linear or branched chain,  
10 saturated or unsaturated, aliphatic or aromatic hydrocarbon groups with 1-30 carbon atoms,  $R^3$  represents a hydrogen atom or a methyl, ethyl, n-propyl, iso-propyl, n-butyl, 2-butyl or 2-methyl-2-butyl group,  $x$  is a value between 1 and 30 and,  $k$  and  $j$  are values between 1 and 12, preferably  
15 between 1 and 5. When the value of  $x$  is  $\geq 2$  each  $R^3$  in the formula above can be different.  $R^1$  and  $R^2$  are preferably linear or branched chain, saturated or unsaturated, aliphatic or aromatic hydrocarbon groups with 6-22 carbon atoms, where group with 8 to 18 carbon atoms are  
20 particularly preferred. For the group  $R^3$  H, methyl or ethyl are particularly preferred. Particularly preferred values for  $x$  are comprised between 1 and 20, preferably between 6 and 15.

25 As described above, in case  $x \geq 2$ , each  $R^3$  in the formula can be different. For instance, when  $x=3$ , the group  $R^3$  could be chosen to build ethylene oxide ( $R^3=H$ ) or propylene oxide ( $R^3=methyl$ ) units which can be used in every single order for instance (PO)(EO)(EO), (EO)(PO)(EO), (EO)(EO)(PO),  
30 (EO)(EO)(EO), (PO)(EO)(PO), (PO)(PO)(EO) and (PO)(PO)(PO). The value 3 for  $x$  is only an example and bigger values can

11019P1GB

be chosen whereby a higher number of variations of (EO) or (PO) units would arise.

Particularly preferred end-capped polyoxyalkylated  
5 alcohols of the above formula are those where k=1 and j=1  
originating molecules of simplified formula:

10 The use of mixtures of different non-ionic surfactants is particularly preferred in ADW formulations for example mixtures of alkoxylated alcohols and hydroxy group containing alkoxylated alcohols.

15 The first composition may optionally comprise materials which serve as phase stabilizers and/or co-solvents. Example are C<sub>1</sub>-C<sub>3</sub> alcohols such as methanol, ethanol and propanol. C<sub>1</sub>-C<sub>3</sub> alkanolamines such as mono-, di- and triethanolamines can also be used, by themselves or in  
20 combination with the alcohols. The phase stabilizers and/or co-solvents can, for example, constitute 0 to 1 wt%, preferably 0.1 to 0.5 wt%, of the composition.

The first composition may optionally comprise  
25 components which adjust or maintain the pH of the compositions at optimum levels. The pH may be from, for example, 1 to 13, such as 8 to 11 depending on the nature of the composition. For example a dishwashing composition desirably has a pH of 8 to 11, a laundry composition  
30 desirable has a pH of 7 to 9, and a water-softening composition desirably has a pH of 7 to 9. Examples of pH adjusting agents are NaOH and citric acid.

The second composition may be any composition that generates a gas on exposure to the atmosphere or water. This generation need not be instantaneous. The composition 5 may only generate a gas gradually or over an extended period, for example several weeks or months, or even up to one year. Preferably, the second composition comprises a moisture-sensitive component. For example, the second composition may be or may contain a bleach. Examples of 10 bleaches are, for example, listed in WO 99/06522. These include oxygen releasing bleaching agent such as a hydrogen peroxide source and an organic peroxyacid bleach precursor compound or a preformed organic peroxyacid. Examples of hydrogen peroxide sources are inorganic perhydrate bleaches 15 such as the alkali metal salts of perborate, percarbonate, perphosphate, persulfate and persilicates. Examples of organic peroxyacid bleach precursors are listed in WO 99/06522. The bleaches also include chlorine releasing agents such as hydantoins, for example 1,3-dichloro-5,5- 20 dimethyl hydantoin, hypochlorites such as sodium hypochlorite or dichloroisocyanurates such as sodium dichloroisocyanurate.

It should be noted that some of the components in the 25 second composition may be the same as some of the components in the first composition. Preferably, however, the first composition is devoid of moisture-sensitive components, such as a bleach.

30 The second composition may be a solid or a liquid. Preferably, the second composition is a compressed solid or a particulate solid.

The second composition is contained in a second compartment. In one embodiment, the second compartment is defined by a housing formed of a water-soluble polymer, such 5 as one of the polymers mentioned herein. The housing may be formed using any of the methods described herein, including, for example, thermoforming and injection moulding. In one embodiment, the second composition is in the form of a solid, for example, a solid ball or pill, which is 10 surrounded by a coating of a suitable material. The second compartment may be placed in the first compartment, before the first compartment is sealed.

The second composition may alternatively be included in 15 a sealing member, which is placed on top of the pocket and sealed thereto. In one embodiment, a coated ball or pill may be coupled to the sealing member using an adhesive, or mechanical means, such that when the sealing member is placed over the pocket, the coated ball or pill is at least 20 partially enclosed by the first compartment. This arrangement may be especially appropriate when the sealing member has a degree of rigidity, for example, when it has been produced by injection moulding.

25 It is also possible for a previously prepared container containing the second composition to be adhered to the sealing member. For example, a sealing member in the form of a film may have a partially or completely filled compartment containing a composition attached thereto. The 30 second composition or compartment may be held on the under side of the sealing member, such that when the sealing member is positioned over the pocket, the second compartment

11019P1GB

extends inside the first compartment. In a preferred embodiment, the first compartment is only partially filled before the sealing member is placed over it. However, once the sealing member is placed over the first compartment, the 5 first compartment appears to be full, because of the volume occupied by the second compartment.

In one embodiment, the underside of the sealing member is provided with a housing for the second composition. This 10 is especially appropriate when the sealing member is flexible, for example in the form of a film. When the sealing member is placed over the first compartment, the housing is positioned within the first compartment. Thus, any composition contained within the housing may be at least 15 partially enclosed by the first composition in the first compartment. Such a housing may conveniently be formed by thermoforming. It may be possible to fill the housing with the second composition before or after the sealing member is placed over the first compartment. Preferably, the housing 20 is filled before the first compartment is sealed with the sealing member.

The sealing member may be placed on top of the pocket and sealed thereto. For example, the sealing member in the 25 form of a film may be placed over a filled pocket and across the sealing portion, if present, and the films sealed together at the sealing portion. In general, there is only one compartment or composition in or on the sealing member, but it is possible to have more than one compartment or 30 composition if desired, for example 2 or 3 compartments or compositions.

The second compartment may be formed by any technique. For example it can be formed by vertical form fill sealing the second composition within a film, such as by the process described in WO 89/12587. It can also be formed by having an 5 appropriate shape for an injection moulding.

However, it is preferred to use a vacuum forming or thermoforming techniques, such as that previously described in relation to the first compartment of the container of the 10 present invention. Thus, for example, a pocket surrounded by a sealing portion is formed in a film, the pocket is filled with the second composition, a film is placed on top of the filled pocket and across the sealing portion and the films are sealed together at the sealing portion. In 15 general, however, the film placed on top of the filled pocket to form the second compartment does not itself comprise a further compartment.

Further details of this thermoforming process are 20 generally the same as those given above in relation to the first compartment of the container of the present invention. All of the above details are incorporated by reference to the second compartment, with the following differences:

25 The second compartment is smaller than the first compartment. In general the first compartment and the second compartment (or composition if not held within a compartment) have a volume ratio of from 2:1 to 20:1, preferable 4:1 to 10:1. Generally the second compartment 30 does not extend across the sealing portion.

The thickness of the film comprising the second compartment may also be less than the thickness of the film making up the first compartment of the container of the present invention, because the film is not subjected to as much localised stretching in the thermoforming step. It is also desirable to have a thickness which is less than that of the film used to form the first compartment to ensure a sufficient heat transfer through the film to soften the base web if heat sealing is used.

10

The thickness of the covering film is generally from 20 to 160  $\mu\text{m}$ , preferably from 40 to 100  $\mu\text{m}$ , such as 40 to 80  $\mu\text{m}$  or 50 to 60  $\mu\text{m}$ .

15 This film may be a single-layered film but is desirably laminated to reduce the possibility of pinholes allowing leakage through the film. The film may be the same or different as the film forming the first compartment. If two or more films are used to form the film comprising the 20 second compartment, the films may be the same or different. Examples of suitable films are those given for the film forming the first compartment.

The first compartment and the sealing member may be 25 sealed together by any suitable means, for example by means of an adhesive or by heat sealing. Mechanical means is particularly appropriate if both have been prepared by injection moulding. Other methods of sealing include infra-red, radio frequency, ultrasonic, laser, solvent, vibration 30 and spin welding. An adhesive such as an aqueous solution of PVOH may also be used. The seal desirably is water-soluble if the containers are water-soluble.

If heat sealing is used, a suitable sealing temperature is, for example, 120 to 195°C, for example 140 to 150°C. A suitable sealing pressure is, for example, from 250 to 600 5 kPa. Examples of sealing pressures are 276 to 552 kPa (40 to 80 p.s.i.), especially 345 to 483 kPa (50 to 70 p.s.i.) or 400 to 800 kPa (4 to 8 bar), especially 500 to 700 kPa (5 to 7 bar) depending on the heat sealing machine used. Suitable sealing dwell times are 0.4 to 2.5 seconds.

10

One skilled in the art can use an appropriate temperature, pressure and dwell time to achieve a seal of the desired integrity. While desirably conditions are chosen within the above ranges, it is possible to use one or 15 more of these parameters outside the above ranges, although it would might be necessary to compensate by changing the values of the other two parameters.

In an embodiment of the invention, the sealing member 20 does not comprise the second composition at the time it is placed on top of the first component. Instead the second composition is added afterwards. Thus, for example, it is possible for the sealing member to contain a housing, which is filled, either before or after sealing, by a liquid 25 composition that is allowed to gel in-situ.

If more than one container is formed at the same time from the same sheet, the containers may then be separated from each other, for example by cutting the sealing 30 portions, or flanges. Alternatively, they may be left conjoined and, for example, perforations provided between the individual containers so that they can be easily

11019P1GB

separated a later stage, for example by a consumer. If the containers are separated, the flanges may be left in place. However, desirably the flanges are partially removed in order to provide an even more attractive appearance.

5 Generally the flanges remaining should be as small as possible for aesthetic purposes while bearing in mind that some flange is required to ensure the two films remain adhered to each other. A flange having a width of 1 mm to 8 mm is desirable, preferably 2 mm to 7 mm, most preferably  
10 about 5 mm.

The containers may themselves be packaged in outer containers if desired, for example non-water soluble containers which are removed before the water-soluble  
15 containers are used.

The containers produced by the process of the present invention, especially when used for a fabric care, surface care or dishwashing composition, may have a maximum  
20 dimension of 5 cm, excluding any flanges. For example, a container may have a length of 1 to 5 cm, especially 3.5 to 4.5 cm, a width of 1.5 to 3.5 cm, especially 2 to 3 cm, and a height of 1 to 2 cm, especially 1.25 to 1.75 cm.

25 The primary composition and the secondary composition may be appropriately chosen depending on the desired use of the container.

If the container is for use in laundry washing, the  
30 first composition may comprise, for example, a detergent, and the second composition may comprise a bleach, stain remover, water-softener, enzyme or fabric conditioner. The

11019P1GB

article may be adapted to release the compositions at different times during the laundry wash. For example, a bleach or fabric conditioner is generally released at the end of a wash, and a water-softener is generally released at 5 the start of a wash. An enzyme may be released at the start or the end of a wash.

If the container is for use as a fabric conditioner, the first composition may comprise a fabric conditioner and 10 the second composition may comprise an enzyme which is released before or after the fabric conditioner in a rinse cycle.

If the container is for use in dish washing the first 15 composition may comprise a detergent and the second composition may comprise a water-softener, salt, enzyme, rinse aid, bleach or bleach activator. The article may be adapted to release the compositions at different times during the laundry wash. For example, a rinse aid, bleach 20 or bleach activator is generally released at the end of a wash, and a water-softener, salt or enzyme is generally released at the start of a wash.

Preferably, the container is for use in laundry 25 washing.

The containers of the present invention will now be further described with reference to Figures 1. This illustrates an example of a container which can be produced.

30

Figure 1 depicts a container 10 comprising a first composition 12, and a second compartment 14 which comprises,

11019P1GB

for example, a bleach. The first composition 12 is held within the container 10 in a first compartment 16. The second composition is held within a second compartment 18. The second compartment 18 is provided on the underside of a 5 sealing member 20, which sealingly engages the first compartment 16.

The first composition 12 is an anhydrous laundry detergent composition. The second composition 14 is a 10 bleach. The first composition 12 is a transparent gelled liquid, whereas the second composition 14 is a particulate solid.

#### Examples

15

##### Comparative Example A

A two-compartment container was formed as follows:

20 A film of PVOH (PT75 Aicello) was sealed by hand to form an open sachet, which was subsequently filled with 8g of a dish-washing gel (see Gel 1 in Table 1 below). The gel-containing sachet was then sealed. A similar open sachet was filled with 12g of a moisture-sensitive powder (see 25 Powder 1 in Table 1 below). This powder-filled sachet was then sealed, and placed adjacent the first sachet to form the two-compartment container. 50% of the surface area of the powder-containing compartment was enclosed by the gel-containing compartment.

30

Example 1

A three-compartment container was formed as follows:

5        A film of PVOH (PT75 Aiceillo) was sealed by hand to form an open sachet, which was subsequently filled with a 12g of a moisture sensitive powder (see Powder 1 in Table 1 below). The powder-containing sachet was then sealed. Two further open sachets were each filled with 8g of a dish-washing gel (see Gel 1 in Table below). Each gel-filled sachet was then sealed, and placed on opposite sides of the powder-filled sachet to form a three-compartment container. Almost 100% of the surface area of the powder-containing compartment was enclosed by the gel-containing compartments.

15

Example 2

The containers of Comparative Example A and Example 1 were stored under 40°C and at 75%relative humidity for 4 weeks.

20        The amount of TAED and benzotriazole in the containers of Comparative Example A and Example 1 was measured over the four weeks. It was found that TAED and benzotriazole were found to be at least 50% more stable in the container of Example 1 than in the container of Comparative Example A. In the container of Comparative Example A, more O<sub>2</sub>-gas was formed than in Example 1.

**Claims**

1. A water-soluble container comprising at least one first compartment, said one or each first compartment containing a composition that comprises less than 5 wt% free water, and a second compartment containing a second composition, wherein the second composition generates a gas on exposure to the atmosphere or water, and more than 50% of the surface area of the second compartment is enclosed by the first compartment or first compartments.
2. A container according to claim 1 wherein at least 60% of the surface area of the second compartment is enclosed by the first compartment.
3. A container according to claim 1 or 2 wherein the second composition is moisture-sensitive.
4. A container according to any one of the preceding claims, wherein the first composition is substantially devoid of any component which, when coming into contact with the second composition, would generate a gas.
5. A container according to any one of the preceding claims wherein the first composition comprises less than 3 wt% free water.
6. A container according to claim 5 wherein the first composition is anhydrous.
7. A container according to any one of the preceding claims wherein the first composition is a liquid.

8. A container according to any one of the preceding claims wherein the first composition is transparent.

5 9. A container according to any one of the preceding claims which comprises a gas release means.

10. A container according to claim 9 wherein the second compartment comprises a gas release means.

10

11. A container according to any one of the preceding claims wherein the first compartment has been formed by thermoforming or injection-moulding.

15 12. A container according to any one of the preceding claims wherein the first compartment is sealed with a sealing member, and wherein the sealing member comprises the second compartment containing the second composition.

20 13. A container according to any one of the preceding claims wherein the first compartment and/or the second compartment is formed of a poly(vinyl alcohol).

14. A container according to any one of the preceding  
25 claims wherein the first composition is a detergent composition.

15. A container according to any one of the preceding claims wherein the second composition is a solid.

30

16. A container according to claim 15 wherein the second composition is a compressed solid which is enclosed by a film or coating of a water-soluble polymer.

5

17. A container according to any one of the preceding claims wherein the second composition comprises a bleaching agent.

10 18. A process for producing a container as defined in any one of the preceding claims, which comprises:

i) forming an open container, at least partially filling the container with the first composition and with the second compartment containing the second composition and  
15 sealing the container; or

ii) forming an open container, at least partially filling the container with the first composition and sealing the container with a sealing member comprising the second composition.

AbstractIMPROVEMENTS IN OR RELATING TO CONTAINERS

5 A water-soluble container comprising at least one first compartment, said one or each first compartment containing a composition that comprises less than 5 wt% free water, and a second compartment containing a second composition, wherein the second composition generates a gas on exposure to the  
10 atmosphere or water, and more than 50% of the surface area of the second compartment is enclosed by the first compartment or first compartments.
